

MedLens Trust Report

Query: statin primary prevention

Verdict: Low risk

The use of statins for primary prevention of cardiovascular disease in adults is associated with reduced mortality and cardiovascular outcomes. The US Preventive Services Task Force has issued a recommendation statement on the use of statins for primary prevention, and the evidence supports the use of statins in this context. However, there is some debate about the causal link between LDL-C and cardiovascular disease, with one review arguing that the evidence does not support a causal link.
