

MedLens Trust Report

Query: statin therapy cardiovascular prevention

Verdict: Low risk

Statin therapy is effective in primary and secondary cardiovascular disease prevention, with clinical trials and reviews providing evidence to support its use. The use of statin therapy in elderly patients and high cardiovascular risk patients is also supported, with some studies suggesting the use of upfront lipid-lowering combination therapy. Overall, the evidence suggests that statin therapy is a valuable tool in the prevention of cardiovascular disease.
